

Scalability & Future Plan

1. Live API Integration

Scaling the app to connect directly with regional meteorology APIs (like OpenWeatherMap API) to pull live cloud cover and precipitation inputs automatically based on coordinates.

2. Geospatial Map Layers

Embedding Mapbox maps representing historical flood inundation boundaries to provide spatial warnings.

3. Evacuation Broadcasters

Connecting Twilio SMS API relays to automatically push alerts to regional emergency response teams when the model predicts flood risks.
